TECHNICAL DATA

Operating temperature	*Operating temperature 0-40°C, humidity 35..95uR%*
Sealing	*Front panel IP65 (with optional gasket) , Box IP30, Terminal blocks IP20*
Material	*PC ABS UL94V0 self-extinguishing*
Digital Inputs	*3PNP/NPN configurable as analogue for potentiometers. (max 28 Vdc in PNP mode)*
Outputs OUT 24V	*2 relays 5A resistive charge 30mA(24Vac),40mA(24 Vdc),60mA (110...230Vac)*
Back-UP	*Rechargeable battery, approx. 7days autonomy*
Programming Software	*Labsoftview 2.6 or later*
Power Supply	*24...230Vac/Vdc +/-15% 50/60Hz / 2W*

INTRODUCTION

Thanks for choosing a Pixsys device.

Timer TCT101 can be set in 5 different modes: Timer-ON, Timer-OFF, Pause-Work, Oscillator, PWM (time-proportioned output), all options with independent setting of ON-OFF time.
3 digital inputs are available (NPN/PNP/Potential free contact) for external commands like Start, Stop, Reset; one input is also analogic in order to allow the modification of working times by external potentiometer.
5 different time bases (hundredths, tenths, seconds, minutes, hours).

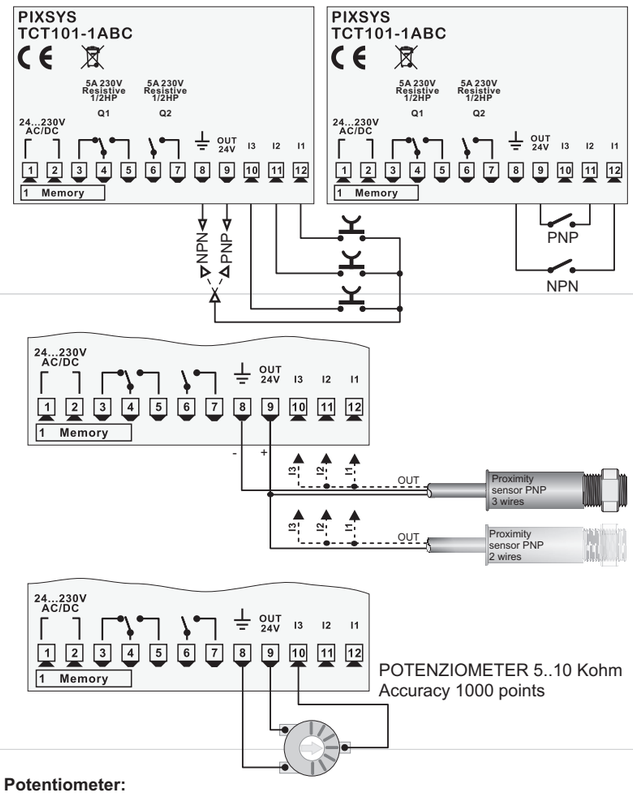
Read carefully the safety guidelines and programming instructions contained in this manual before using/connecting the device.

Disconnect power supply before proceeding to hardware settings or electrical wirings.

Only qualified personnel should be allowed to use the device and/or service it and in accordance to technical data and environmental conditions listed in this manual.

Do not dispose electric tools together with household waste materials in observance of European Directive 2002/96/CE

WIRING DIAGRAM



POTENZIOMETER 5..10 Kohm
Accuracy 1000 points

Potentiometer:
To modify Set1 or Set2 by external potentiometer follow the steps below:
1- use potentiometers 5kOhm to 10kohm
2- connect cursor to pin I3; a wrong connection may damage the potentiometer and lead to lock of the device.
3- accuracy on input is max 1000 points, therefore set the parameters "Upper limit" and "Lower limit" with a max difference of 1000 units.
(Ex.: LoS1 to 50,0 and uPS1 to 150,0 to modify time value related to Set1 between 50 and 150 seconds with steps of one tenth). Greater differences would make unstable the less significant digit.
4- To calibrate the scale of potentiometer enter the configuration mode and select:
Hin.3 as Pot
Fin.3 as Set1 or Set2
P.tAr as Enable
Exit configuration mode and place potentiometer at minimum level and press ▲ key, then place potentiometer at max level and press premere ▼ key: the device automatically exit the calibration procedure.
N.B.: A switch-off of the device would interrupt the calibration.

MEMORY CARD (optional)

Parameters and setpoint values can be copied from one device to another using the Memory car.

There are two methods:

> With the device connected to the power supply
insert the memory card **when the controller is off**.

On activation display 1 shows and display 2 shows ----

(Only if the values stored on Mmeory Card are correct).

By pressing the ▲ key display 2 shows LoAd

Confirm using the ▼ key .

The device loads the new data and starts again.

> With the controller disconnected from the power sup

The memory card is equipped with an internal battery with uses.

Insert the memory card and press the programming button.

When writing the parameters, the LED turns red and on completing the procedure it changes to green. It is possible to repeat the procedure.

⚠ **UPDATING MEMORY CARD.**

To *update* the memory card values, follow the procedure described in the first method, setting display 2 to ---- so as not to load the parameters on controller.

Enter configuration and **change at least one parameter**.
Exit configuration. Changes are saved automatically.

LOADING DEFAULT VALUES

This procedure restores the factory settings of the instrument.

LOADING DEFAULT SETTINGS

	PRESS	EFFECT	OPERATION
1	FNC for 3 seconds	Display 1shows 0000 and 1st digit flashes, Display 2 shows PASS	
2	▲ o ▼	Modify the flashing digit, press SET to reach the next digit	Enter password 9999
3	SET to confirm	The device loads default values (factory settings)	Switch-off and restart the device

MODIFY PARAMETERS

	PRESS	EFFECT	OPERATION
1	FNC for 3 seconds	Display 1 shows 0000 and 1st digit flashes, display 2 shows PASS	
2	▲ Or ▼	Modify flashing digit, press SET to reach the following digit	Enter password 1234
3	SET to confirm	Display shows first parameter of configuration table Func	
4	▲ Or ▼	Scroll the parameters	
5	SET + ▲ Or ▼	Increade or decrease value on display by pressing SET and one of the arrow keys at same time	Enter new data which will be stored releasing the keys
6	FNC	End of configuration, the device exits programming mode.

Note 1: In this timer mode, if P-06 Active State Input 1 = Rising Edge or P-09 Function Input 1 = Disable, at the end of the count (reaching the set), the timer automatically goes to STOP.
Note 2: This function does not reset the timer value, therefore requires an input for reset.
Note 3: This function resets the timer at the instant of the STOP command.
Note 4: This function resets the timer at the instant of the START command.
Note 5: This function is active only if P-06 Active State Input 1 = Rising Edge
